Final Exam S4
Computer Architecture

Duration: 1 hr 30 min

Write answers only on the answer sheet.

Exercise 1 (3 points)

Complete the table shown on the answer sheet. Write down the new values of the registers (except the **PC**) and memory that are modified by the instructions. **Use the hexadecimal representation. Memory and registers are reset to their initial values for each instruction.**

Initial values:

```
D0 = $0007003D  A0 = $00005000  PC = $00006000
D1 = $12340004  A1 = $00005008
D2 = $FFFFFFFC  A2 = $00005010

$005000  54 AF 18 B9 E7 21 48 C0
$005008  C9 10 11 C8 D4 36 1F 88
$005010  13 79 01 80 42 1A 2D 49
```

Exercise 2 (2 points)

Complete the table shown on the answer sheet. Determine the missing number for each addition in order to match the given flags (use the hexadecimal representation). **If multiple answers are possible, choose the smallest one.**

Exercise 3 (4 points)

Let us consider the following program. Complete the table shown on the answer sheet.

```
Main        move.l  #-218,d7

next1       moveq.l #1,d1
            cmpi.b  #$30,d7
            blo     next2
            moveq.l #2,d1

next2       move.l  d7,d2
            lsr.l   #8,d2
            ror.w   #4,d2
            lsl.l   #8,d2

next3       clr.l   d3
            move.l  #$FFFFFFFF,d0
loop3       addq.l  #1,d3
            subq.b  #1,d0
            bne     loop3

next4       clr.l   d4
            move.b  #$20,d0
loop4       addq.l  #1,d4
            dbra    d0,loop4        ; DBRA = DBF
```

Exercise 4 (11 points)

All the questions in this exercise are independent. **Except for the output registers, none of the data or address registers must be modified when the subroutine returns.**

A color is made up of three components (the red, green and blue components). A color is encoded in a 32-bit word as follows: $00RRGGBB_{16}$

- RR represents the red component (8-bit unsigned integer between 0_{16} and FF_{16}).
- GG represents the green component (8-bit unsigned integer between 0_{16} and FF_{16}).
- BB represents the blue component (8-bit unsigned integer between 0_{16} and FF_{16}).

For instance:

- If the encoded value of a color is $002B048D_{16}$, the red component is $2B_{16}$, the green component is 04_{16} and the blue component is $8D_{16}$.
- The encoded value for the black color is 00000000_{16}.
- The encoded value for the white color is $00FFFFFF_{16}$.

1. Write the **`SplitColor`** subroutine that returns the three components of a color.
   Input: **D0.L** holds a 32-bit encoded color ($00RRGGBB_{16}$).
   Outputs: **D1.B** = Red component of the color (RR).
   D2.B = Green component of the color (GG).
   D3.B = Blue component of the color (BB).

   The `SplitColor` subroutine must contain 10 lines of instructions at the most (`RTS` included).

2. By using the **`SplitColor`** subroutine, write the **`IsGray`** subroutine that determines whether a color is in grayscale. That is, if the the three components of the color are equal.
   Input: **D0.L** holds a 32-bit encoded color ($00RRGGBB_{16}$).
   Output: **D0.L** = 0 (false), if the color is not in grayscale.
   D0.L = 1 (true), if the color is in grayscale.

   The `IsGray` subroutine must contain 13 lines of instructions at the most (`RTS` included).

3. By using the **`IsGray`** subroutine, write the **`IsAllGray`** subroutine that determines whether all the colors in an array are in grayscale. Each element in the array is a 32-bit encoded color ($00RRGGBB_{16}$).
   Inputs: **A0.L** points to the first element of an array of colors.
   D0.L holds the number of elements in the array.
   Output: **D0.L** = 0 (false), if at least one color in the array is not in grayscale.
   D0.L = 1 (true), if all the colors in the array are in grayscale.

   The `IsAllGray` subroutine must contain 13 lines of instructions at the most (`RTS` included).

An Address register (16/32-bit, n=0-7)
Dn Data register (8/16/32-bit, n=0-7)
Rn any data or address register
s Source, **d** Destination
e Either source or destination
#n Immediate data, **i** Displacement
BCD Binary Coded Decimal
↑ Effective address

SSP Supervisor Stack Pointer (32-bit)
USP User Stack Pointer (32-bit)
SP Active Stack Pointer (same as A7)
PC Program Counter (24-bit)

SR Status Register (16-bit)
CCR Condition Code Register (lower 8-bits of SR)
N negative, **Z** zero, **V** overflow, **C** carry, **X** extend
***** set according to operation's result, **≡** set directly
- not affected, **0** cleared, **1** set, **U** undefined

1 Long only; all others are byte only
2 Assembler calculates offset
3 Branch sizes: **.B** or **.S** -128 to +127 bytes, **.W** or **.L** -32768 to +32767 bytes
4 Assembler automatically uses A, I, Q or M form if possible. Use #n.L to prevent Quick optimization

Revised by Peter Csaszar, Lawrence Tech University – 2004-2006

ANSWER SHEET TO BE HANDED IN

Exercise 1

Instruction	Memory	Register
Example	`$005000  54 AF 00 40 E7 21 48 C0`	A0 = `$00005004` A1 = `$0000500C`
Example	`$005008  C9 10 11 C8 D4 36 FF 88`	No change
`MOVE.W #0560,-6(A1)`		
`MOVE.B -(A1),-57(A2,D0.W)`		
`MOVE.B -1(A1),$4(A1,D2.L)`		

Exercise 2

Operation	Size (bits)	Missing Number (hexadecimal)	N	Z	V	C
`$4570 + $?`	16		1	0	1	0
`$F431C16A + $?`	32		0	1	0	1

Exercise 3

Values of registers after the execution of the program. **Use the 32-bit hexadecimal representation.**	
D1 = $	**D3** = $
D2 = $	**D4** = $

Exercise 4

```
SplitColor
```

```
IsGray
```

```
IsAllGray
```
